Vinyl Removal Tips

- Heat : Always heat the vinyl and the surrounding area, being careful not to burn the vinyl, surface or yourself. A heat gun works well. A space heater, hair dryer, or even the sun can also work.
- After heating try and lift a small area using your fingernail or a small plastic scraper. Once the decal is started you can pull on it at a 45 degree angle and it should slowly lift, taking some or most of the adhesive with it. Only use a metal razor blade on glass
- Once you get the decal totally removed, an adhesive remover can be used to dissolve the glue left behind.
- Please call for further information on your specific application
